

Product Requirements Document (PRD): ACME Global Salary Management

Target User: HR Manager

Target Scale: 10,000 Employees across multiple international offices

1. Goal & Problem Statement

- **Problem:** ACME's HR team manages salary data for 10,000 global employees using disparate, fragile spreadsheets. This leads to high maintenance overhead, lack of data validation, slow reporting, and poor visibility into organizational compensation.
- **Goal:** Deliver a centralized, web-based platform that allows HR managers to manage employee compensation records efficiently and gain instant analytical insights into how ACME pays its global workforce.

2. In-Scope Features

Employee & Compensation Management

- **Paginated Data Grid:** Efficient, server-side paginated list optimized to browse and search 10,000 employee records with sub-second response times.
- **Multi-Attribute Filtering & Sorting:** Instant filtering by Country, Department, Job Title, and Employment Type, with multi-column sorting (e.g., base salary, bonus).
- **CRUD Operations & Validation:** Form-based workflows to add, update, and soft-delete employee salary profiles with built-in validation (e.g., positive numerical values, valid currency codes, required fields).

Compensation Analytics & Reporting ("How ACME Pays")

- **Summary KPI Metrics:** Real-time aggregation of total annual payroll, average salary, median salary, and currency distribution.
- **Departmental & Geographic Breakdown:** Visual breakdown comparing compensation distributions across departments and operating countries to identify pay equity trends and departmental budget allocations.
- **Search & Export:** Quick full-text search by employee name/ID and CSV export capabilities for filtered reporting views.

System Performance & Seeding

- **Database Seeding:** Realistic synthetic seed dataset containing 10,000 active/inactive records distributed across multiple global regions.
- **Indexed Queries:** Relational database indexes on frequently queried fields (country, department, salary, status) to avoid table scans.

3. Deliberately Out-of-Scope (Trade-offs & Justification)

Out of Scope Feature	Reasoning / Justification
Complex Multi-Tier RBAC	The target persona is strictly the HR

	Manager. Adding complex role hierarchies (e.g., employee self-service, line-manager approvals) adds unneeded authorization bloat for the core MVP.
Automated Payroll Execution & Banking Integration	ACME needs a salary <i>management and intelligence</i> platform, not a direct payment gateway or automated tax-filing processor.
Historical Compensation Auditing & Versioning	While valuable in enterprise systems, full temporal salary change logs require complex event-sourcing or versioned tables, which shifts focus away from delivering fast global aggregation and core management flows.
Real-Time Currency Conversion APIs	Live exchange rate APIs introduce external latency, rate-limiting, and network failure points. The system will store native currency amounts alongside standardized base-currency equivalents.

4. Non-Functional Requirements

- **Performance:** Server-side pagination and database queries must respond in <200ms over the 10,000-record dataset.
- **Reliability:** Core calculations and CRUD operations backed by deterministic unit and integration tests.
- **Data Integrity:** Strict relational foreign keys and schema constraints.
